Network Solutions for Industrial Weighing and Process Control

SOFTWARE

Product Description

New CellScale Virtual Monitor (CVM) Version 2 software is the ultimate computer

based solution for CellScale wireless networks. CVM enables your PC to act as a full-featured digital scale indicator with data logging and information publishing features - providing the information gateway from MSI's CellScale Product Family to any computer platform.

The program provides a graphical interface that enables complete scale control and configuration of all weighing parameters. Multiple display modes allow monitoring of statistical data, set points, battery levels, and multiple scale and math channels at once. Large, scale control buttons enable simple operation with touch screen devices. In addition, CVM provides password-protected access to the full 10-point calibration capabilities of CellScale.

The data logging features provided by CVM software allow users to capture and store all of their weight information and more. The Macro Processor enables user defined text data to be combined with the weight information and saved to any text based file format; including HTML, XML and SQL.
